SOFTWARE REQUIREMENTS SPECIFICATION (SRS)

Project: AgriMart – Farmers Online Selling Website

Subject	Fundamentals of Full Stack (FFS)	**Project Type**	First-Year Mini Project
Version	1.0	**Technology**	HTML5 and CSS3

1. Introduction

1.1 Purpose: This document specifies the requirements for AgriMart, a simple website that presents agricultural products online and helps customers find farmers' contact details. It describes the project's purpose, scope, users, main features, and constraints.

1.2 Scope: AgriMart is a front-end website concept that showcases products such as rice, vegetables, fruits, seeds, and organic produce. Each product may include a name, image, short description, indicative price, and farmer contact information. The mini-project version uses HTML for page structure and a separate CSS file for styling. It does not include online payment, live stock updates, user accounts, or database storage.

1.3 Objectives:

- Help farmers display agricultural products in one online place.
- Let customers browse products and view sample prices and descriptions.
- Encourage direct communication between farmers and customers.
- Demonstrate basic webpage design using HTML and CSS.

2. Overall Description

2.1 Product Perspective: AgriMart is a standalone educational website prototype viewed in a web browser. Its content is maintained in the project files; no back-end server is required for this version.

2.2 Intended Users: Farmers provide product details and contact information; **customers** browse products and contact farmers; the **student developer** maintains the website and updates sample content.

2.3 Operating Environment: A current web browser on a desktop, laptop, tablet, or smartphone. Project files include an HTML file and a separate CSS file. Internet access is only needed if externally hosted images or fonts are used.

2.4 Assumptions and Constraints: Product details and prices are sample data. The prototype does not verify farmers, guarantee availability, handle orders, or securely store personal information. Any real contact details must be used only with permission.

3. System Features and Requirements

3.1 Home Page: Display the AgriMart name, tagline (“From Farmers to Your Home”), navigation menu, and a short introduction to the website.

3.2 Product Listing: Display product cards for agricultural items. Each card should show the product name, image or placeholder, brief description, and sample price with a clear layout.

3.3 Farmer Contact Information: Provide a contact section with sample farmer names and permitted contact details, or a clearly labelled demonstration contact method. The page should make it easy for customers to identify how to enquire.

3.4 About and Contact Sections: Explain the purpose of connecting farmers and customers. Include a simple contact area for general enquiries.

4. Functional Requirements

- **FR-1:** The website shall display a home section and navigation links.
- **FR-2:** The website shall show a list or grid of agricultural products.
- **FR-3:** Each product entry shall show a name and short description; sample prices and images may also be included.
- **FR-4:** The website shall provide a farmer/contact section.
- **FR-5:** Navigation links shall move users to the relevant page sections.
- **FR-6:** HTML content and CSS styling shall be kept in separate files.

5. Non-Functional Requirements

- **Usability:** Text, menus, and product cards should be clear and easy to understand.
- **Responsive design:** The layout should adapt to mobile and desktop screen sizes.
- **Performance:** The page should load quickly by using simple code and appropriately sized images.
- **Compatibility:** The website should work in commonly used modern browsers.
- **Maintainability:** HTML and CSS should be organised and readable so content and appearance can be updated easily.

6. Hardware and Software Requirements

Hardware: Computer or smartphone with a web browser.
Software: Text editor (such as Notepad or Visual Studio Code) and a modern browser (such as Chrome, Edge, or Firefox).
Languages: HTML5 and CSS3.

7. Limitations and Future Enhancements

This version is a static prototype; it does not support registration, product uploads, order placement, payment, or database storage. In future, JavaScript, a back-end service, and a database could be added for farmer accounts, product management, search, and order tracking.

8. Conclusion

AgriMart aims to make agricultural product information easier to discover and demonstrates the basic principles of web development. The proposed HTML and CSS prototype provides a simple, organised interface through which customers can browse sample farm products and learn how to contact farmers.
